

SPF 30 TEXAS HYBRID BLUEGRASS

Poa arachnifera x Poa pratensis

DESCRIPTION

Now professional turf managers can add genetic diversity with a high-performance Texas Bluegrass x Kentucky Bluegrass cross. Expanding the area of adaptation for Bluegrasses, Texas x Kentucky Bluegrass types have been successful farther south than traditional Kentucky Bluegrasses and are adding heat tolerance and summer performance to turf in northern zones. SPF 30 produces a high percentage of living ground cover throughout the summer, recovers quickly from drought, and is resistant to brown patch. With its aggressive rhizomes, SPF 30 improves the ability of Tall Fescue turf to recover when combined in a mixture. It has demonstrated persistence in partial shade areas in warm-season regions where low light conditions are not suitable for Bermudagrass. SPF 30 is an elite and medium-bladed Bluegrass for landscape contractors, sports turf managers, and golf course superintendents who are battling the stress of summer heat. SPF 30 (exp. HB 128) is a sister to Thermal Blue (esp. HB 129) with similar qualities and improved dark color.

APPLICATIONS

Sports fields, golf courses, lawn turf

Use SPF 30 in blends with other Bluegrasses, Perennial Ryegrass, and in multi-species mixes at the rate of 10-35% by weight to increase density, durability, and genetic diversity. Add to Turf-Type Tall Fescue at the rate of 5-15% by weight to increase density, improve brown patch resistance, and aid in stress recovery.

GEOGRAPHICAL ADAPTATION

Cool-season and transition zone, arid regions with irrigation

SEEDING RATE (pounds/1,0000 ft²) *

Overseeding: 1-2
New seeding: 2-3

*local conditions vary and dictate rates

FEATURES & BENEFITS

Brown patch resistant
Deep and aggressive rhizomes
Excellent turf quality
Summer active
Heat and wear tolerant
Quick drought recovery
Fast establishing

SEEDS PER POUND (approximate)

1,200,000
